

Client Portal Concept

IMPROVING TRANSPARENCY AND CLIENT COLLABORATION

Why AnchorzUp Needs a Client Portal

Current Situation

AnchorzUp manages multiple client web projects simultaneously. Currently, communication and collaboration happen across **email, Slack, Google Drive, Jira**, and occasional spreadsheets.

While these tools are powerful individually, they lack a centralized client facing hub. This results in:

- ▶ **Fragmented communication:** Clients must search multiple channels for updates or documents.
- ▶ **Lack of transparency:** Clients often ask for project status or milestone progress.
- ▶ **Inefficient feedback loops:** Feedback is lost in threads or mixed across platforms.
- ▶ **Version confusion:** Multiple document versions (in Drive/email) cause inconsistencies.

Opportunity

A **web based Client Portal** could serve as a **single source of truth** for all client facing activities combining project visibility, file access, and communication in one streamlined interface.

This would:

- ▶ **Improve client trust and satisfaction** through transparency.
- ▶ **Reduce PM overhead** spent updating clients manually.
- ▶ **Enhance AnchorzUp's professional image** as an organized, tech driven partner.

Target Users & Needs

User Type	Goals	Frustrations / Pain Points	Expectations from Portal
Client Project Leads	- Monitor overall progress - Access documents easily - Communicate updates	- Hard to track milestones - Lost documents/emails - Unclear who to contact	- Real time project status - Organized deliverables - Simple messaging
AnchorzUp Project Managers	- Share updates quickly - Receive feedback clearly - Reduce repetitive communication	- Repeating updates across channels - Feedback scattered in threads	- Single dashboard for client communication
AnchorzUp Developers / Designers	- Access shared files / feedback - Reduce noise	- Missing latest client input	- Unified feedback visibility

Proposed Solution Overview

A **lightweight Client Portal web app** where each client logs in to view and interact with their project workspace.
It connects project data from internal systems (Drive, Jira, Slack) into a single, client friendly interface.

MVP Features

Feature	Description
Dashboard Overview	Shows project name, current phase, % completion, key milestones, and risks.
Milestones & Deliverables	Timeline or checklist with completion status and due dates.
Documents Hub	Centralized upload/view/download of deliverables (linked with Google Drive).
Communication Thread	Simplified message board or comment area for announcements and feedback.
Client Feedback Form	Quick structured form for project or milestone feedback.

Future Enhancements (Post MVP)

- Live Jira issue summary (active tickets, blockers).
- Slack integration for instant message relay.
- Custom branding per client (logo, theme).
- Notification system (email/SMS when updates posted).
- Role based access (for multiple stakeholders within one client).

High-Level User Flow

Expected Benefits & Success Metrics

The tangible outcomes this product should achieve are:

- Improved client satisfaction and trust through transparency.
- Reduced project manager workload and repetitive communication.
- Faster client feedback and approval cycles.
- Centralized and organized access to project documents and deliverables.
- Increased client engagement and adoption of the portal.

Metric	Target	Visualization Idea
Client satisfaction	+25%	(25%)
PM time spent on updates	−40%	(40%)
Client feedback response time	−30%	(30%)
Document versioning errors	<5%	(5%)
Portal adoption rate	80%+	(80%)

Open Questions & Validation Areas

Area	To Validate	Proposed Next Steps
Authentication	Should we enable Google login or use internal credentials	Test 2 options with internal pilot clients.
Data Sources	Pull data from Jira, or sync manually via APIs?	Run tech spike on API integrations.
File Management	Store in Drive or internal storage	MVP: Drive folders per project.
Feedback Interface	Should it be a chat thread or structured form	Conduct user interviews with 3 or 4 clients.
Hosting & Security	Need role based access + SSL + audit logs.	Review with DevOps & Security team.

Next Steps (Discovery & Prototyping Roadmap)

- Conduct 3–4 discovery interviews with clients and PMs to validate assumptions.
- Create wireframes and a clickable prototype (Figma).
- Review technical feasibility with engineering.
- Define MVP scope, timeline, and cost for initial rollout.
